PRACTICAL-1: Project Initiation, Requirement Analysis, Sitemap, Wireframe, and GitHub Setup

Problem Definition: Initiate the semester-long StudentHub portal by identifying the problem scope, user roles, key modules, navigation flow, and minimum 10 pages. Create a sitemap, low-fidelity wireframe, project folder structure, README file, and GitHub repository.

Output:

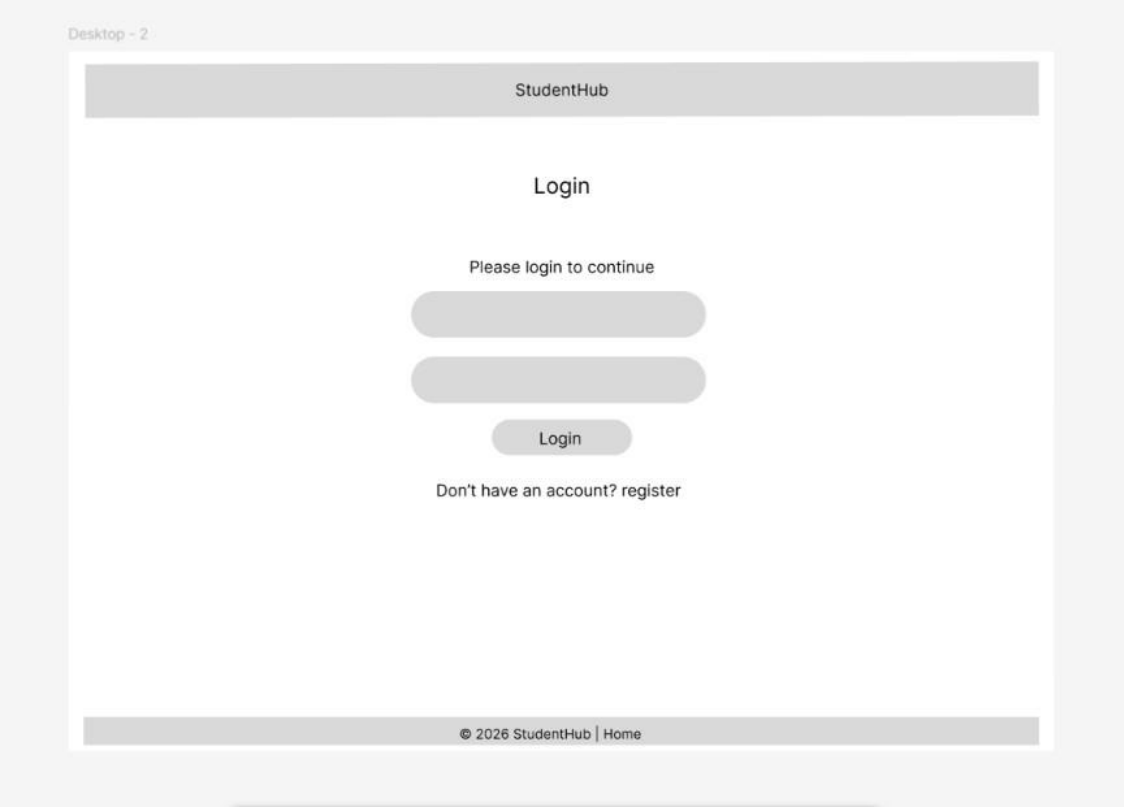

SITEMAP:

HOME:

LOGIN:

REGISTER

Repository link:

- https://github.com/manthan5033/WEB-DEVELOPMENT/tree/main/practical-1

Key-Questions:

1. What is URL and Parts of URL?

URL (Uniform Resource Locator) is the address of a webpage or resource on the Internet. Its main parts are Protocol, Domain Name, Path, Query String, and Fragment.

2. How is an HTML File Processed in a Web Browser?

The browser receives the HTML file, reads and parses the code, loads CSS, JavaScript, and other resources, and then displays the webpage.

3. How Will Page Navigation Flow Be Managed Among All HTML Pages? Navigation will be managed using the <a> tag and href attribute to connect different HTML pages through links and navigation menus.

4. How Will GitHub Commits Be Maintained After Each Practical? After each practical, the completed files will be committed with a clear message and pushed to GitHub to maintain the history of work.

Learning:

- Understood how to define the problem scope and requirements of the StudentHub portal.
- Identified different user roles, such as students and faculty, and their responsibilities.
- Learned to organize the portal into important modules and pages with proper navigation flow.
- Created a sitemap and low-fidelity wireframes to plan the website structure and layout.
- Learned how to maintain a proper project folder structure, README file, and GitHub repository for project management.

PRACTICAL-2: Semantic HTML5 Pages with Accessibility-Ready Structure

Problem Definition: Develop static HTML5 skeletons for at least 10 StudentHub pages such as Home, About, Register, Login, Dashboard, Events, Profile, Contact, Admin, FAQ, and Feedback. Use semantic tags and accessibility-friendly structure.

Output:

Repository link:

- https://github.com/manthan5033/WEBDEVELOPMENT/tree/main/Practical-2

Key-Questions:

1. Are semantic tags used properly?

--Yes, semantic tags such as <header>, <nav>, <main>, <section>, <article>, <aside>, and <footer> are used properly.

2. Are form labels and other elements accessible?

--Yes, proper form labels, headings, image alt text, and navigation links are used for accessibility.

3. Is the page structure consistent?

--Yes, a consistent structure is maintained across all pages.

Learning: ▪ Developed static HTML5 skeletons for 10+ StudentHub pages.

- Used semantic tags such as <header>, <nav>, <main>, <section>, and <footer>.
- Created pages including Home, About, Register, Login, Dashboard, Events, Profile, Contact, Admin, FAQ, and Feedback.

- Applied an accessibility-friendly structure using proper headings, labels, links, and image alt text.
- Maintained a consistent layout and navigation structure across all pages.

Web Development

PRACTICAL-3: Responsive UI Design using CSS Grid, Flexbox, and Bootstrap/Tailwind

Problem Definition: Design responsive layouts for Home, About, Registration, Dashboard, and Events pages using CSS Grid and Flexbox. Optional to use CSS framework such as Bootstrap or Tailwind. Ensure mobile-first responsiveness.

Output:

Repository link:

https://github.com/manthan5033/WEBDEVELOPMENT/tree/main/Practical-3

Key-Questions:

1. How does the layout adapt for mobile, tablet, and desktop screens?

-- The layout uses media queries to adapt from a single-column mobile layout to two-column tablet and multi-column desktop layouts.

2. Which layout technique is used and why?

-- CSS Grid is used for page sections and cards, while Flexbox is used for navigation

3. Are typography, spacing, colors, and contrast readable?

-- Typography, spacing, colors, and contrast are kept simple and clear for easy reading on all screen sizes.

4. Is the framework used consistently without unnecessary inline CSS?

-- CSS is maintained in a common external stylesheet, avoiding unnecessary inline CSS and keeping the design consistent across all pages

Learning:

Web Development

- Learned how to make layouts mobile-friendly using media queries.
- Learned how to adjust layouts for mobile, tablet, and desktop screens.
- Learned to use an external CSS file instead of unnecessary inline CSS.
- Learned how to design multiple pages with a consistent layout and navigation.
- Maintained a consistent layout and navigation structure across all pages.

Web Development Framework

PRACTICAL- 4: JavaScript DOM Manipulation, Event Handling, and UI Interactivity

Problem Definition: Add dynamic UI components such as collapsible FAQ, modal popup, image/content slider, notification banner, hamburger menu, and light/dark theme switcher using JavaScript.

Output:

Repository link:

https://github.com/manthan5033/WEBDEVELOPMENT/tree/main/Practical-4

Key-Questions:

1. How are DOM elements selected and modified?

-- DOM elements are selected using methods such as getElementById(), querySelector(), and querySelectorAll(). Their content, styles, or classes can be modified using JavaScript.

2. Are event listeners attached correctly?

-- Yes. Event listeners such as click, change, and DOMContentLoaded are attached using addEventListener() to make the components interactive.

3. Is localStorage used for remembering theme choice?

-- Yes. localStorage stores the user's selected theme. When the website is opened again, JavaScript retrieves the saved theme and applies it automatically.

4. Does interactivity improve usability without breaking accessibility?

--Yes. Interactive features should be simple and accessible. Buttons should be keyboard-friendly, have clear labels, and use proper HTML elements so that all users can interact with the website easily.

Web Development Framework

Learning:

- Understanding DOM and how JavaScript interacts with HTML elements.
- Learning how to dynamically modify webpage content and styles.
- Learning to debug JavaScript errors using browser Developer Tools.
- Learning how to create a better user experience through interactivity.
- Testing different user interactions and handling possible errors.

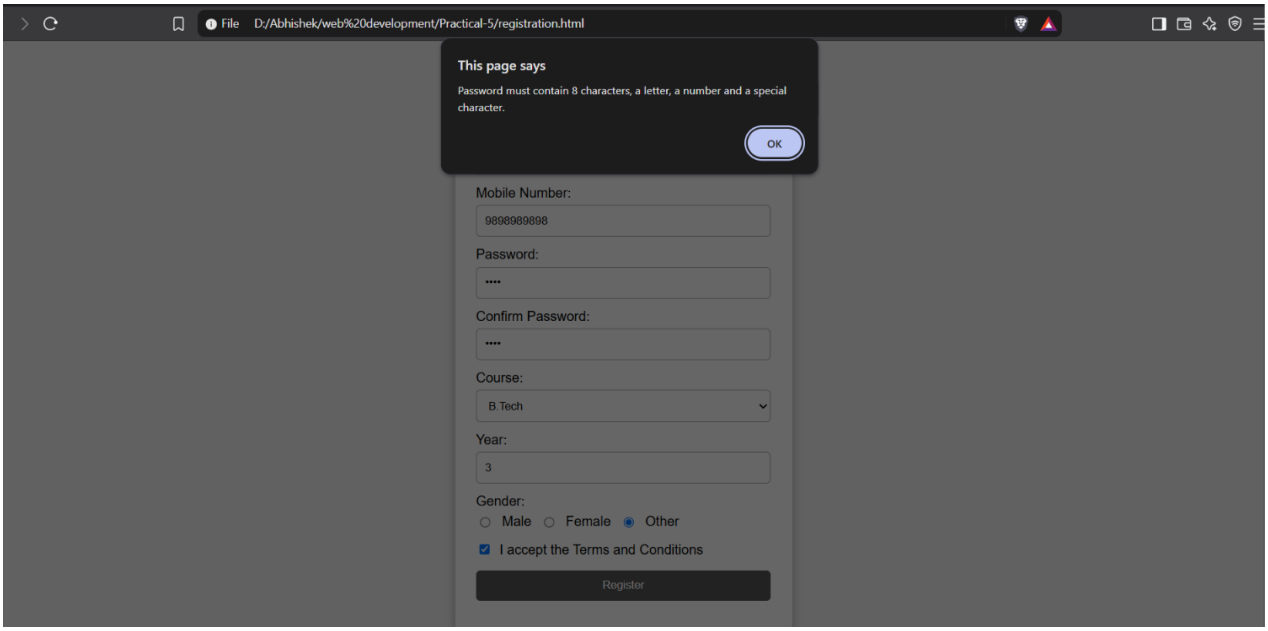

PRACTICAL:- 5

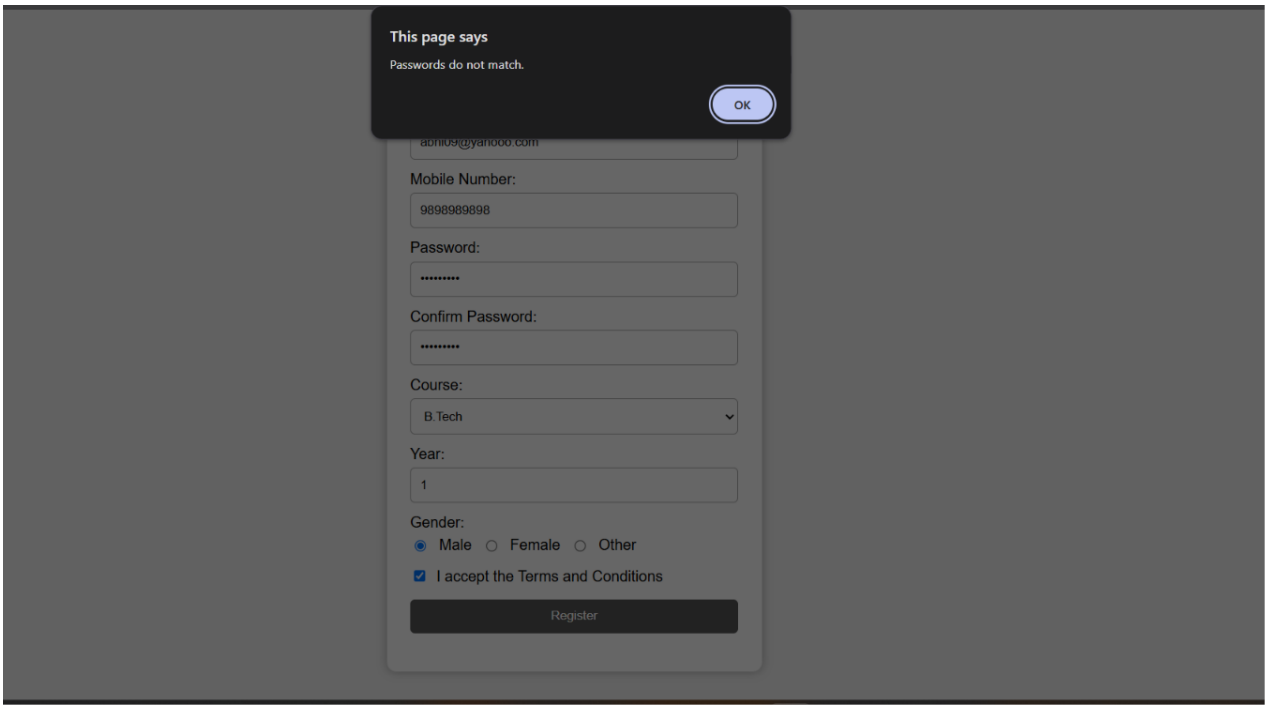

PROBLEM STATEMENT:-

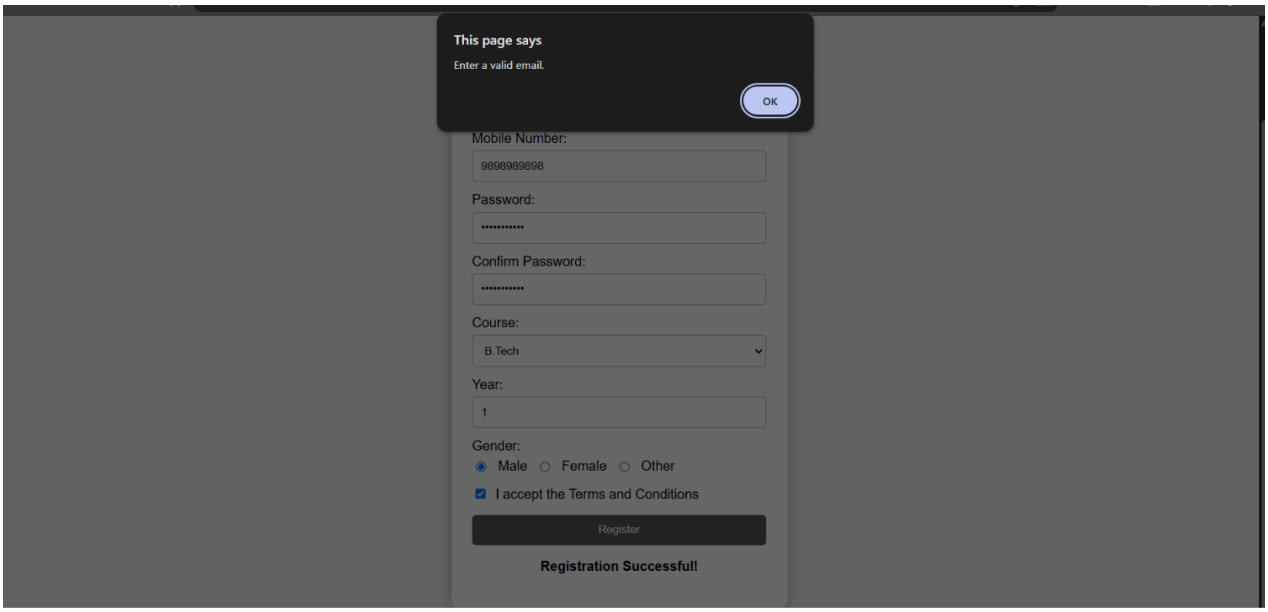

Create a student registration form with HTML5 input types and JavaScript validation for name, email, mobile number, password, confirm password, course, year, gender, and terms acceptance. Use Regular Expression for validations.

Practical :-14

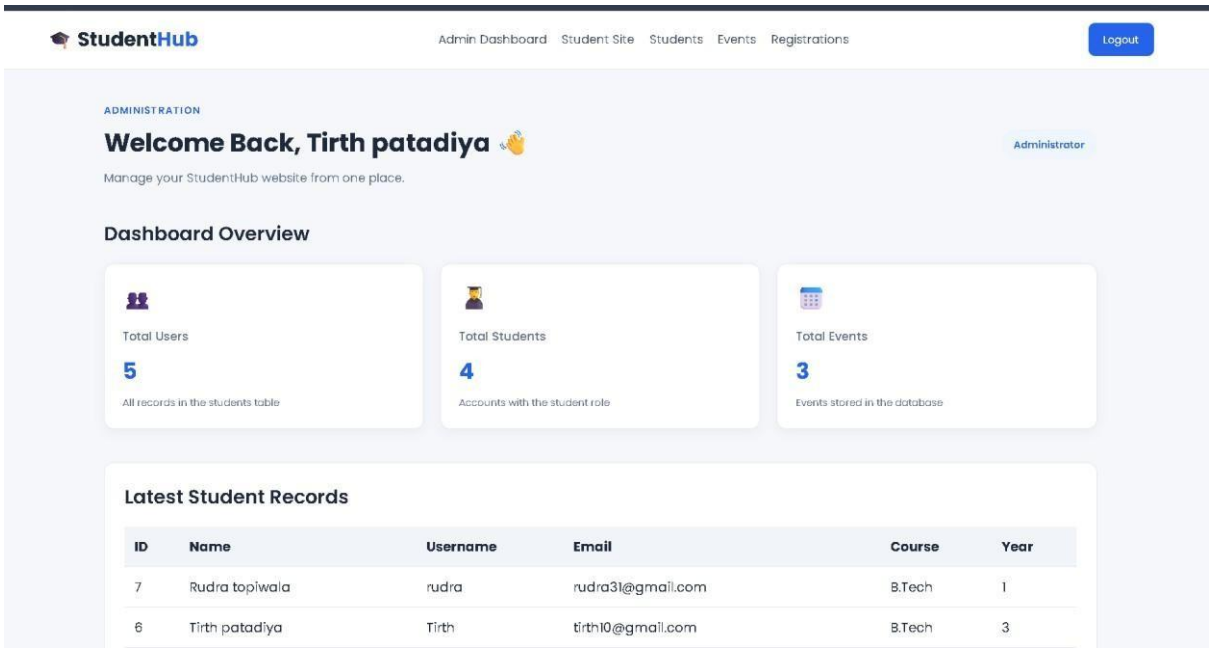

Problem statement :

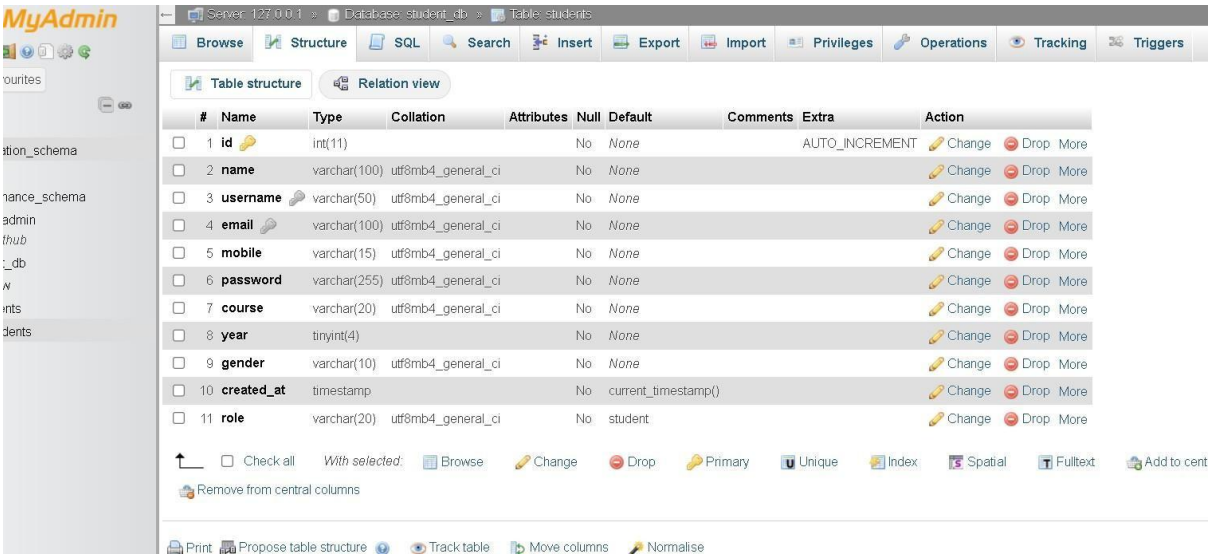

Develop an admin dashboard that displays user statistics, student count, event count and latest registrations. Restrict access to admin users only and show dynamic menu options based on role.

Practical -15

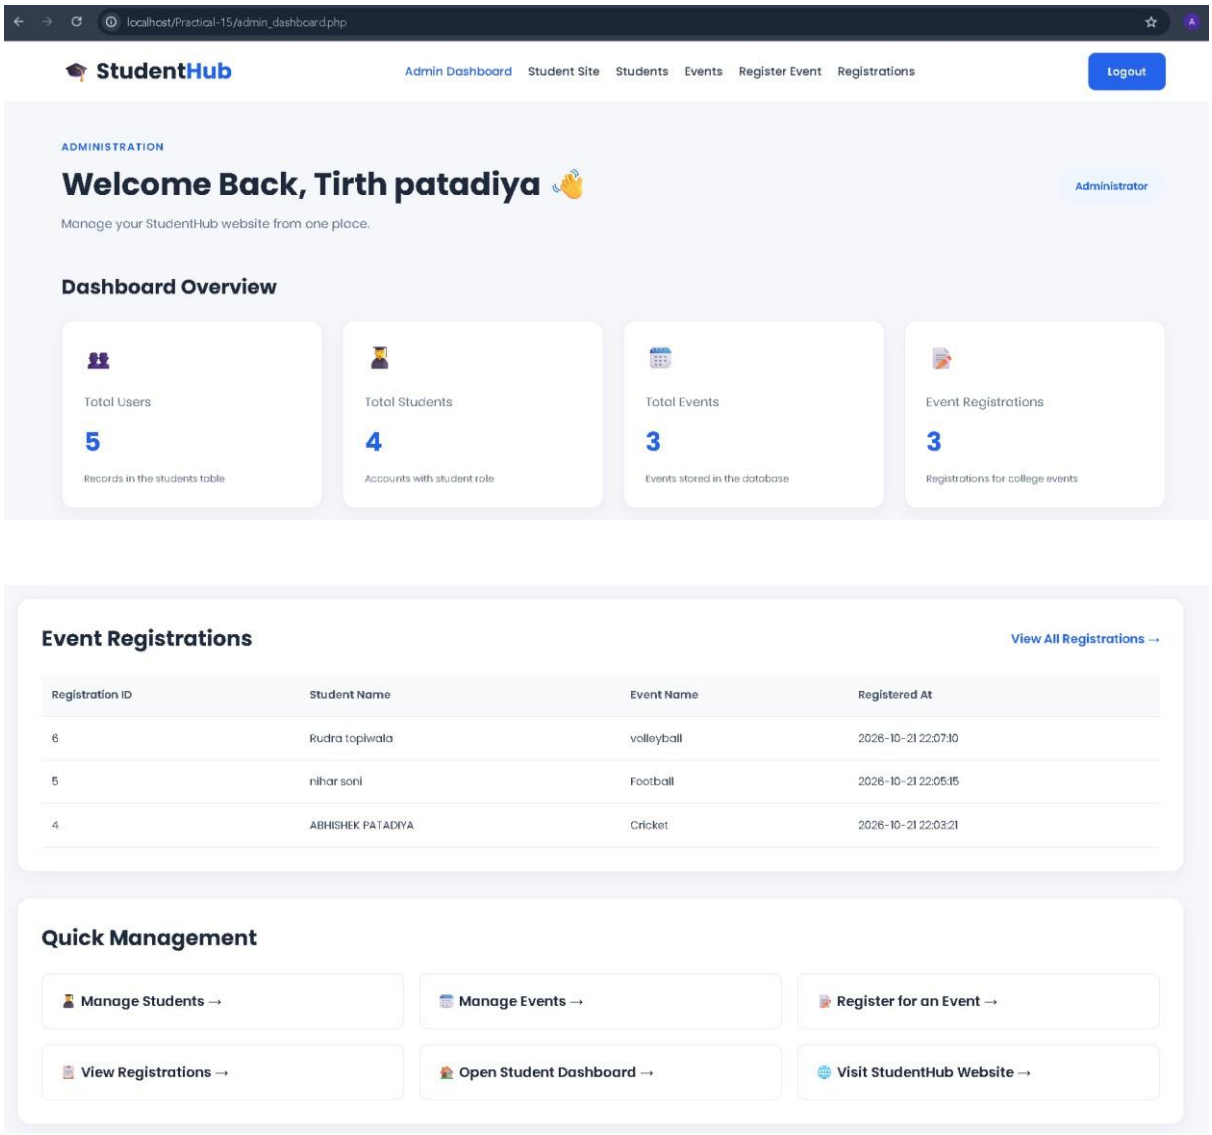

Problem statement:

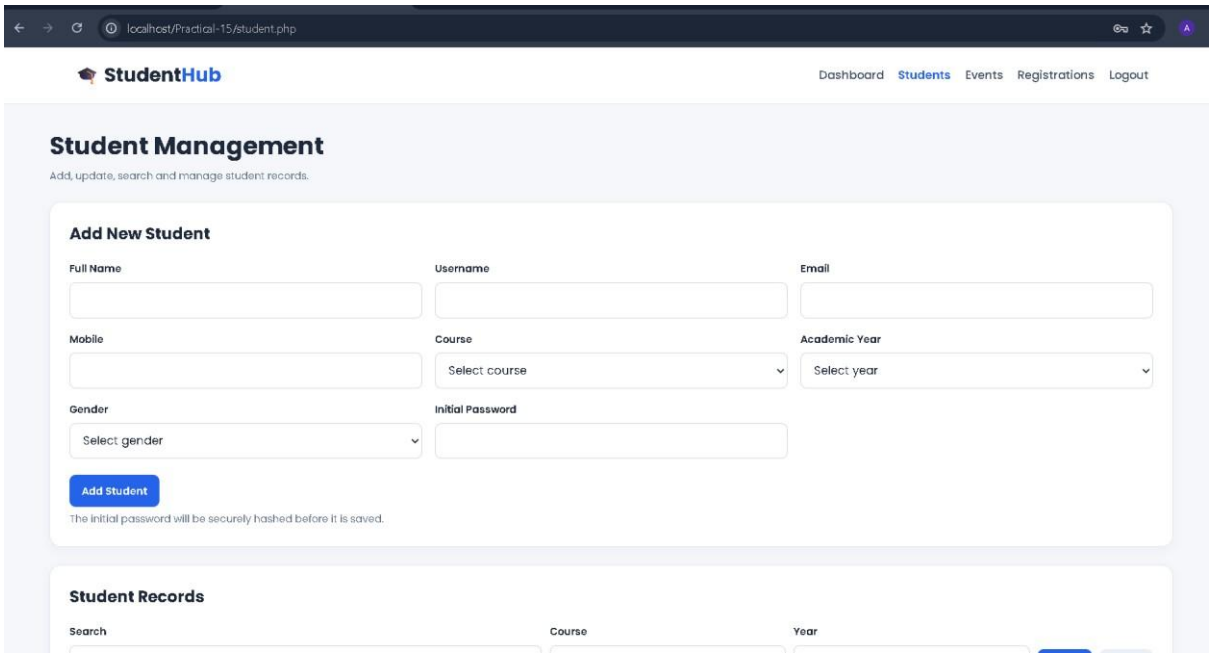

Integrate all modules into a single deployable StudentHub portal. Verify navigation, responsiveness, authentication, database operations, security checks, AJAX functionality, and documentation. Deploy locally using XAMPP/Apache virtual host and submit GitHub repository.
