PRACTICAL- 4: JavaScript DOM Manipulation, Event Handling, and UI Interactivity

Problem Definition: Add dynamic UI components such as collapsible FAQ, modal popup, image/content slider, notification banner, hamburger menu, and light/dark theme switcher using JavaScript.

Output:

Repository link:

https://github.com/manthan5033/WEB-DEVELOPMENT/tree/main/Practical-4

Key-Questions:

1. How are DOM elements selected and modified?

-- DOM elements are selected using methods such as getElementById(), querySelector(), and querySelectorAll(). Their content, styles, or classes can be modified using JavaScript.

2. Are event listeners attached correctly?

-- **Yes. Event listeners such as click, change, and DOMContentLoaded are attached using addEventListener() to make the components interactive.**

3. Is localStorage used for remembering theme choice?

-- Yes. localStorage stores the user's selected theme. When the website is opened again, JavaScript retrieves the saved theme and applies it automatically.

4. Does interactivity improve usability without breaking accessibility?

--Yes. Interactive features should be simple and accessible. Buttons should be keyboard-friendly, have clear labels, and use proper HTML elements so that all users can interact with the website easily.

Learning:

- Understanding DOM and how JavaScript interacts with HTML elements.
- Learning how to dynamically modify webpage content and styles.
- Learning to debug JavaScript errors using browser Developer Tools.
- Learning how to create a better user experience through interactivity.
- Testing different user interactions and handling possible errors.
